

Project Summary

Public-interest field science at the Old Glory Peak transect corridor
Working Draft 0.1 / July 28, 2026

Whole Body Foundation is developing a field research station in Morongo Valley, California. The project combines repeatable geomagnetic mapping, mineral identification, water-quality testing, dryland agriculture, natural-material structures, and open public documentation.

PURPOSE

The first objective is a durable baseline across the Old Glory Peak corridor. Four field transects cross mapped fault structures and the ridge itself. Each station links magnetic field strength to GPS location, lithology, mineral assemblage, and photographic evidence.

PLACE

The study corridor spans the Pinto Mountain Fault, Morongo Valley Fault, and the regional context of the Emerson Fault and 1992 Landers rupture zone. Historical mining in the Morongo District provides a documented context for mineralized quartz vein systems.

METHOD

- Environmental geophysics: smartphone magnetometer transects calibrated against USGS aeromagnetic data; standard field mineral tests; ORP, pH, heavy-metal, and mineral-content water testing.
- Community psychophysiology: a future IRB-reviewed matched-community study using 5-minute RMSSD recordings and monthly salivary cortisol sampling.
- Network and systems science: decision-latency, local economic-velocity, and community-network scaling analysis.

FIELD SYSTEM

A 10-foot, metal-free 2V geodesic dome will serve as the field station. A 1,000-gallon gravity-fed cistern supports three productive growing spirals. An air-gapped Raspberry Pi 5 field computer stores GPS-stamped notes locally without a cloud dependency.

FIRST-YEAR PLAN AND BUDGET

The first phase targets 50 GPS-tagged points, completion of Transects A-D, an open field log, and a published mineral catalog by December 2026. A \$75,000 first-year plan prioritizes field collection, data stewardship, construction, insurance, and public documentation.

OPEN SCIENCE COMMITMENT

Hypotheses will be pre-registered before collection. De-identified datasets, negative results, replication materials, and annual financial summaries will be published under a CC-BY license where ethically and legally permitted.

STATUS: Planning document. Site access, scientific review, fiscal sponsorship, and human-subjects approval must be confirmed before the corresponding activities begin.
